

## The Life Cycle of a Flower

Leaves appear as if overnight,

Spreading out to catch the light.

Once fully grown, a flower is spotted,

With seeds inside and petals dotted.

Flowers pink and blue and red,

Now have seeds they need to spread.

Blown by the wind; carried by a bird,

Caught on fur; it can seem absurd.

But when you are fixed into the ground,

These are the ways to spread around.

No matter how, no matter when,

The cycle will now start again.

Once in the soil, the seed is in,

The cycle of life will now begin.
